Not illustrated. 1886 Excerpt: . . . in which the thumb points, the induced current will tend to flow in the direction in which the third finger points. This is called Flemings rule. In this as well as in the other rules, it is evident that if one of the conditions be reversed, then the current, or the motion, as the case may be, will be in the opposite direction, while if two conditions be reversed, the current or the motion will be in the same direction. For instance, if a north pole be grasped similarly in the left hand it will give the conditions of a motor or of Oersteds experiment, the thumb in that case pointing in the direction of the motion which the wire (not the magnet) will have if the current in it flows in the direction as indicated by the third finger. In connection with the above rules it must be remembered, as before pointed out, that it is the electromotive force and not the current which is induced, and that, therefore, the electric polarity of such a wire in which induction takes place, is the reverse of what it would have to be to cause that current to flow through the conductor. In other words, as the positive pole of the inductor is the one out of which the current tends to flow, it follows that the current in the inductor itself flows from its negative to its positive pole, just as in a battery in which...
